CANDIDATE MOTHPROOFERS:

Toxicity to Fabric Insects and Persistence Through Washing and Drycleaning

Historic, archived document

Do not assume content reflects current scientific knowledge, policies, or practices.

PREFACE

This publication reports the results of a series of tests of various compounds that were thought to have potential as mothproofers. Such tests are continuing, and further results will be published at intervals. The study upon which the report was based is part of a broad program of research on methods of protecting fabrics and materials in storage from insect damage. Those compounds that continue to show promise in the screening tests will be tested further.

Trade names are used in this publication solely for the purpose of providing specific identification of the compounds tested. Mention of a trade name does not constitute a guarantee or warranty of the product by the U.S. Department of Agriculture or an endorsement over other products not mentioned.

The chemical names in this report are according to the *Chemical Abstracts* system of nomenclature. Mrs. E. M. Osborne of the Pesticide Chemicals Research Branch, Entomology Research Division, Agricultural Research Service, verified the nomenclature of the compounds.

This publication reports research involving pesticides. It does not contain recommendations for their use, nor does it imply that the uses discussed here have been registered. All uses of pesticides must be registered by appropriate State and Federal agencies before they can be recommended.

CAUTION: Pesticides can be injurious to humans, domestic animals, desirable plants, and fish or other wildlife—if they are not handled or applied properly. Use all pesticides selectively and carefully. Follow recommended practices for the disposal of surplus pesticides and pesticide containers.

Candidate Mothproofers: Toxicity to Fabric Insects and Persistence Through Washing and Drycleaning Part II

Bv

J. H. Lang, biological technician, R. E. Bry, research entomologist, and

Agricultural Research Service, United States Department of Agriculture

SUMMARY

In standard Chemical Specialties Manufacturers Association (CSMA) 14-day mothproofing tests, 101 compounds were investigated as potential mothproofers. The compounds were applied to the cloth at 0.5 and 3 percent by weight. The test insects were larvae of the black carpet beetle, *Attagenus megatoma* (Fabricius). Results were evaluated according to excrement weight. Cloths treated with 44 compounds were satisfactorily protected in pre-

cleaning tests on the basis of all requirements of the test method. Cloths treated with 10 of these compounds at both calculated deposit levels and with 19 compounds at the 3 percent by weight rate of application were also satisfactorily protected after one washing. Cloths treated at both calculated deposit levels with 13 compounds and with five compounds at the higher calculated deposit level were satisfactorily protected after one drycleaning.

INTRODUCTION

Inexpensive and safe mothproofers to protect against such damage are urgently needed. In support of this need, the Agricultural Research Service conducts a continuing program at Savannah, Ga., to determine the effectiveness of candidate compounds in protecting wool, mohair, animal hair, and feathers against fabric-insect damage. The persistence of the

effectiveness of these compounds through washings and drycleanings is also determined. The compounds found most promising in these preliminary tests are selected for further research as mothproofers when applied under conditions simulating practical home and industrial treatments.

PROCEDURE

Moth test cloth (100-percent wool), considered the standard test fabric by the American Association of Textile Chemists and Colorists and the Chemical Specialties Manufacturers Association, was used exclusively as the test fabric. Samples of cloth, measuring 3 by 4 inches, were impregnated with the test compounds at calculated deposit levels of 0.5 and

3 percent by weight of the cloth. The compounds were formulated as either methyl alcohol or acetone solutions. After treatment, the cloths were thoroughly aired for 3 days to remove volatile constituents. The treated cloths were then cut into 1- by 2-inch pieces and subjected to biological evaluation.

The biological mothproofing evaluations were conducted in accordance with the CSMA excrement weight test method. Each treated cloth was exposed individually in a petri dish to 10 larvae of the black carpet beetle, Attagenus megatoma (Fabricius), for the prescribed 14-day test period. In such an exposure, the insects had the choice of staying on or off the treated cloth. The test insects were 10 to 12 weeks old and weighed 6 to 7 milligrams each. One series of samples (four 1- by 2-inch pieces of cloth) was used from each deposit level. The petri dishes with the insects and test cloth were kept in a darkened cabinet in a room held at a constant temperature of $80^{\circ} \pm 2^{\circ}$ F. and 60 \pm 5 percent relative humidity.

If the treated cloths showed resistance to insect feeding in the initial tests, an additional series of samples from the same treatment was washed once and another series drycleaned once to determine the resistance of the treatments to cleansing. These samples were then exposed to the test insects in the same manner as described for the initial tests. All cleansings were done in a Launder-Ometer, the standard laboratory machine specified by the American Association of Textile Chemists and Colorists

for washing and drycleaning tests. The test samples were washed for 30 minutes at 100° F. in a solution of 5 grams of neutral soap per liter of water with a water-to-fabric ratio of 30:1 (weight to weight). After being washed. the materials were squeezed by hand, and then given a 10-minute rinse at 80° F. using the same water-to-fabric ratio as in the washing. The drycleaning process consisted of placing two pieces of the treated fabric, 1 by 2 inches. in 50 milliliters of Stoddard solvent and agitating them for 20 minutes at 90° F. The excess solvent was squeezed out by hand and the cloth laid on a horizontal screen to dry at room temperature. When dry, the fabric was pressed with a steam iron and allowed to stand for another day before being tested.

The results were evaluated according to excrement weight and the treated cloth was considered to be satisfactorily resistant to carpet beetle feeding if (1) not more than 5 milligrams of excrement was deposited by the 10 larvae provided that (2) under the same conditions not less than 15 milligrams of excrement was deposited by the 10 larvae on the control specimens.

RESULTS

Results with cloths treated with the 101 compounds identified on pages 6 and 7 are summarized in tables 1, 2, and 3. Cloths treated with 44 of the compounds at one or both of the calculated deposit levels (0.5 and 3 percent by weight of the cloth) were satisfactorily protected before cleansing in accordance with all criteria established for the CSMA 14-day mothproofing test (tables 1 and 2). Cloths treated with 10 of the 44 compounds at both calculated deposit levels and with 19 compounds at the higher deposit level were satisfactorily protected after one washing. Cloths treated at both calculated deposit levels with 13 compounds and with five compounds at the higher calculated deposit level were satisfactorily protected after

one drycleaning. Cloths treated at one or both calculated deposit levels with 18 compounds were satisfactorily protected after one washing and one drycleaning. Fifteen compounds obtained their effectiveness by action other than toxicity.

Cloths treated with 11 compounds at both rates of application were satisfactorily protected from black carpet beetle larval feeding on the basis of all requirements of the 14-day CSMA test except for the feeding requirement on untreated control specimens (table 3).

Cloths treated with the remaining 46 compounds failed to meet any of the CSMA test criteria.

This laboratory will continue to publish supplementary reports of the results of the program on the preliminary evaluation of experimental compounds as mothproofers.

Index To Compounds Without ENT Numbers

Name 2-Benzothiazolethiol, 5-chloro-, zinc salt Hypochlorous acid, benzyl ester	Item No. 7 36	Name Salicylanilide, 3,4',5-tribromo-, plus about 5% 3,5-dibromosalicylanilide	Item No.
Phenol, 2,2'-thiobis [4,6-dichloro-, zinc salt Salicylanilide, ar, ar'-dibromo-	54 84	m-Salicylotoluidide, 3,5-dibromo- alpha,alpha,alpha-trifluoro- Zinc, bis (butyldithiocarbamato) -	87 98
Salicylanide, 4'5-dibromo-, plus 3,4',5- tribromosalicylanilide (1:1 mixture)	85	Zinc, bis(diallyldithiocarbamato)- Zinc, bis(ethyldithiocarbamato)- Zinc, bis(methyldithiocarbamato)-	99 100 101
